About This Test

A Chikungunya virus IgM rapid antibody test measures the presence of IgM antibodies against the Chikungunya virus in the blood. IgM antibodies are produced by the immune system shortly after infection, indicating a recent or acute infection. This rapid test helps diagnose Chikungunya fever, a mosquito-borne viral disease, in its early stages. By detecting IgM antibodies, healthcare providers can confirm an active Chikungunya infection and differentiate it from other similar illnesses, facilitating timely and appropriate treatment.
