About This Test

HbA1c, or glycated hemoglobin, is a blood test that measures average blood sugar levels over the past 2-3 months. It reflects the amount of glucose that has attached to hemoglobin molecules in red blood cells. Higher HbA1c levels indicate poorer blood sugar control and are used primarily to monitor long-term glucose management in individuals with diabetes. This test is essential for assessing the effectiveness of diabetes treatment plans, guiding adjustments in medications, diet, and lifestyle. Maintaining optimal HbA1c levels reduces the risk of diabetes-related complications such as heart disease, stroke, kidney damage, and nerve problems.
