About This Test

The Serum Ascites Albumin Gradient (SAAG) measures the difference in albumin concentration between the serum and ascitic fluid. This test helps determine the cause o ascites, which is fluid accumulation in the abdominal cavity. A high SAAG (greater than 1.1 g/dL) suggests that the ascites is due to portal hypertension, commonly caused by liver cirrhosis or congestive heart failure. A low SAAG indicates that ascites is due to non-portal hypertensive conditions, such as infections or malignancies.
