About This Test

A TORCH IgM test measures the presence of IgM antibodies against a group of infections: Toxoplasma, Rubella, Cytomegalovirus (CMV), and Herpes simplex virus (HSV). IgM antibodies indicate a recent or acute infection. This test is particularly important for pregnant women, as these infections can cause serious birth defects or complications if transmitted to the fetus. Detecting IgM antibodies helps diagnose recent infections, allowing healthcare providers to take timely steps to manage and reduce the risk to the mother and baby.
