About This Test

Beta-human chorionic gonadotropin (beta-hCG) is a hormone produced by the placenta during pregnancy. It serves as an important marker in early pregnancy testing and monitoring. - **Pregnancy Test**: Beta-hCG levels in urine or blood indicate pregnancy. Its presence confirms pregnancy as early as 10 days after conception. - **Monitoring Pregnancy**: Beta-hCG levels typically double every 48 to 72 hours during early pregnancy. Monitoring these levels helps assess the viability of the pregnancy and detect potential issues such as ectopic pregnancy or miscarriage. - **Diagnosing Trophoblastic Disease**: Abnormal beta-hCG levels may indicate trophoblastic disease, including molar pregnancies or choriocarcinoma. - **Fertility Treatments**: Beta-hCG is used to monitor pregnancies resulting from assisted reproductive techniques like in vitro fertilization (IVF). Overall, beta-hCG measurement is crucial in confirming pregnancy, monitoring early fetal development, and diagnosing certain pregnancy-related complications.
