About This Test

Cryoglobulins measure the presence of abnormal proteins (cryoglobulins) in the blood that precipitate or clump together at low temperatures. This test helps diagnose conditions associated with these proteins, such as cryoglobulinemia, which can cause inflammation and damage to blood vessels. Elevated levels of cryoglobulins are associated with various diseases, including autoimmune disorders, certain infections, and blood cancers. The test aids in diagnosing and managing these conditions by identifying the presence and type of cryoglobulins in the blood.
