About This Test

The HCV total antibodies test using the CLIA (Chemiluminescent Immunoassay) method detects antibodies against Hepatitis C virus (HCV) in blood samples. This test is crucial for diagnosing HCV infection, as it identifies antibodies produced by the immune system in response to the virus. The CLIA technique involves capturing HCV antibodies from the sample using specific antibodies immobilized on a solid surface. A chemiluminescent reaction then generates light in proportion to the amount of HCV antibodies present, which is measured quantitatively. This method is highly sensitive, allowing for early detection of HCV infection and is used for screening individuals at risk, monitoring disease progression, and assessing treatment efficacy in clinical settings.
