

HIV (1&2) ANTIBODY 4TH GENERATION QUANTITATIVE-ELISA

Profile Details | 1 Parameters

Fasting: Fasting is not mandatory | Report Time: Next Day

Specimen Required: Blood

Price- ₹550 **₹480**

Parameters Included

About This Test

HIV (Human Immunodeficiency Virus) is a virus that attacks and weakens the immune system by targeting and destroying CD4 cells, which are critical to the body's defense against infections. Without adequate treatment, HIV can lead to acquired immunodeficiency syndrome (AIDS), a stage where the immune system is severely compromised, making individuals vulnerable to opportunistic infections and certain cancers. HIV is transmitted through blood, sexual contact, and from mother to child during childbirth or breastfeeding. Diagnosis typically involves blood tests to detect HIV antibodies or viral RNA. Early diagnosis and antiretroviral therapy (ART) can significantly manage the virus, reduce viral load, and prevent progression to AIDS. ART helps maintain immune function and reduces the risk of transmitting the virus to others. Regular monitoring and adherence to treatment are essential for long-term health and quality of life for those living with HIV.
