About This Test

The Immunoglobulin IgA test measures the level of IgA antibodies in the blood or other bodily fluids. IgA is a type of antibody primarily found in mucosal areas, such as the respiratory and gastrointestinal tracts, as well as in secretions like saliva, tears, and breast milk. This test helps evaluate immune function by assessing the body's ability to produce IgA, which plays a crucial role in defending against infections at mucosal surfaces. Abnormal IgA levels can indicate conditions such as immune deficiencies, chronic infections, or autoimmune disorders.
