About This Test

The Insulin-Like Growth Factor (IGF) test measures the levels of IGF in the blood, primarily IGF-1. IGF-1 is a protein produced mainly by the liver in response to growth hormone (GH) stimulation. It plays a crucial role in cell growth, development, and repair, influencing various metabolic processes. This test is used to assess growth disorders, such as growth hormone deficiency or excess. Elevated IGF-1 levels can indicate conditions like acromegaly or gigantism, where there is excessive GH secretion. Conversely, low IGF-1 levels may suggest GH deficiency or other underlying health issues. Accurate measurement of IGF-1 helps in diagnosing and managing growth-related disorders and assessing the effectiveness of growth hormone therapy.
