About This Test

The Islet Antibodies test measures the presence of antibodies against the insulin-producing beta cells in the pancreas, specifically targeting proteins like insulin, glutamic acid decarboxylase (GAD), and islet cell antigens. These antibodies are indicative of an autoimmune response, commonly associated with Type 1 diabetes and other autoimmune endocrine disorders. By identifying these antibodies, the test helps diagnose autoimmune diabetes, differentiate it from Type 2 diabetes, and evaluate the risk of developing Type 1 diabetes, guiding treatment and management strategies.
