About This Test

A **nicotine screen urine test** measures the presence and concentration of nicotine and its metabolites (such as cotinine) in a urine sample. Here's what this test assesses: 1. **Nicotine Use**: Determines whether an individual has recently used nicotine products, such as cigarettes, e-cigarettes, nicotine gum, patches, or other forms of tobacco. 2. **Cotinine Levels**: Cotinine is a primary metabolite of nicotine and remains in the body longer than nicotine. The test typically measures cotinine levels to provide a more accurate indication of nicotine use over a longer period. 3. **Exposure to Secondhand Smoke**: Can detect exposure to secondhand smoke, as nicotine and its metabolites can be present in the urine of non-smokers who have been around smokers. 4. **Monitoring Smoking Cessation**: Helps monitor individuals who are trying to quit smoking or using nicotine products, to verify abstinence or identify relapses. 5. **Health Assessments**: Used in various health assessments, such as pre-employment screenings, insurance evaluations, or medical examinations, to identify nicotine use and its potential health impacts. In summary, a nicotine screen urine test measures the presence and levels of nicotine and its metabolites in the urine to determine recent nicotine use, exposure to secondhand smoke, and monitor smoking cessation efforts.
