About This Test

A progesterone measurement determines the level of progesterone, a steroid hormone, in the blood. Progesterone is primarily produced by the ovaries after ovulation and by the placenta during pregnancy. It plays a crucial role in regulating the menstrual cycle, supporting early stages of pregnancy, and preparing the endometrium (uterine lining) for implantation of a fertilized egg. In men and non-pregnant women, the adrenal glands produce small amounts of progesterone. Measuring progesterone levels helps assess ovulation, diagnose infertility issues, monitor the health of a pregnancy, and evaluate menstrual irregularities. Abnormal levels can indicate conditions such as ectopic pregnancy, ovarian cysts, or adrenal gland disorders.
