About This Test

Creatinine is a waste product generated from the normal breakdown of muscle tissue. The kidneys filter creatinine out of the blood, and it is excreted in urine. The creatinine test measures the level of creatinine in the blood or urine and is commonly used to assess kidney function. The test is useful for diagnosing and monitoring kidney diseases, as elevated creatinine levels can indicate impaired kidney function or kidney damage. The normal range for blood creatinine levels varies depending on age, gender, and muscle mass. In addition to blood creatinine tests, the creatinine clearance test can measure how effectively the kidneys are filtering creatinine by comparing creatinine levels in blood and urine over a 24-hour period. This provides a more comprehensive evaluation of kidney function and helps in diagnosing and managing kidney-related health issues.
