About This Test

Smith IgG antibodies measure the presence of antibodies against the Smith (Sm) antigen, a specific protein found in cell nuclei. These antibodies are primarily used to diagnose systemic lupus erythematosus (SLE), an autoimmune disorder. The presence of Smith antibodies is highly specific to SLE, though they are found in only about 20-30% of patients with the condition. Their detection helps confirm an SLE diagnosis, especially when used alongside other clinical and laboratory findings.
