About This Test

A sputum fungal culture measures the presence and type of fungal organisms in a sample of sputum (mucus and other matter coughed up from the lungs). This test helps diagnose fungal infections in the respiratory tract, such as aspergillosis, histoplasmosis, and coccidioidomycosis. The sputum sample is cultured in a laboratory, where it is monitored for fungal growth. Identifying the specific fungus can guide appropriate antifungal treatment and management, particularly in individuals with compromised immune systems or underlying lung conditions.
