About This Test

A stool routine and microscopic examination measures various aspects of stool to diagnose gastrointestinal conditions. This test evaluates: 1. **Physical Characteristics:** Consistency, color, and odor of the stool. 2. **Chemical Analysis:** Presence of blood, pH level, and reducing substances, which can indicate infections or digestive issues. 3. **Microscopic Examination:** Identifies parasites, eggs, cysts, and other microorganisms that can cause infections. It also looks for pus cells, undigested food particles, and fat globules, which can indicate malabsorption or inflammation. The test helps diagnose conditions such as infections (bacterial, viral, parasitic), inflammatory bowel disease, malabsorption syndromes, and bleeding in the gastrointestinal tract. It provides a comprehensive analysis to help pinpoint the cause of gastrointestinal symptoms and guide appropriate treatment.
