About This Test

The Toxoplasma IgG and IgM antibodies test measures the body's immune response to the Toxoplasma gondii parasite. IgG antibodies indicate past exposure and long-term immunity, while IgM antibodies suggest a recent or acute infection. This dual test helps diagnose both current and past toxoplasmosis infections. It's particularly crucial for pregnant women, newborns, and immunocompromised individuals, as it helps determine the timing of the infection and guide appropriate treatment and management to prevent complications.
