About This Test

A Troponin T quantitative test measures the level of troponin T protein in the blood, which is released when heart muscle cells are damaged. Elevated troponin T levels indicate myocardial injury, such as a heart attack or other conditions affecting the heart muscle. This test is crucial for diagnosing acute coronary syndromes, assessing the extent of heart damage, and guiding treatment decisions. It provides valuable information about the heart's condition and helps in managing cardiovascular health.
