About This Test

Beta-2 glycoprotein IgA is an antibody that targets beta-2 glycoprotein I, a protein involved in blood clot regulation. The test measures the levels of these IgA antibodies in the blood to help diagnose antiphospholipid syndrome (APS) and other autoimmune disorders. Elevated levels of beta-2 glycoprotein IgA antibodies are associated with an increased risk of blood clots, recurrent miscarriages, and other complications related to APS. This test is part of a broader panel of antiphospholipid antibodies, which also includes beta-2 glycoprotein IgG and IgM, helping to provide a comprehensive assessment of an individual's risk for thrombotic events and guide appropriate treatment strategies.
