About This Test

Beta-2 glycoprotein IgM measures the levels of IgM antibodies that target beta-2 glycoprotein I (β 2GPI) in the blood. This test is used to diagnose antiphospholipid syndrome (APS), an autoimmune disorder marked by increased risk of blood clots and pregnancy complications. Elevated levels of β 2GPI IgM antibodies indicate an abnormal immune response, where the body attacks β 2GPI, leading to issues with blood coagulation. The presence of these antibodies, along with clinical symptoms, help confirm the diagnosis of APS. This test is part of a comprehensive evaluation of antiphospholipid antibodies, which also includes IgG and IgA antibodies, providing a detailed assessment of thrombotic risk and guiding appropriate medical management.
