About This Test

A cardiolipin antibodies IgM test measures the level of immunoglobulin M (IgM) antibodies against cardiolipin, a lipid found in cell membranes. Elevated IgM levels can indicate antiphospholipid syndrome (APS), an autoimmune condition that increases the risk of abnormal blood clotting, leading to issues like deep vein thrombosis, stroke or recurrent miscarriages. The test is used to assess the likelihood of APS and guide further diagnostic and treatment decisions, often alongside other antiphospholipid antibody tests.
