

FATTY LIVER INDEX

Profile Details | 3 Parameters

Fasting: fasting is not mandatory | Report Time: Same Day

Specimen Required: Blood

Price- ₹2500 **₹1080**

Parameters Included

- LFT- Liver Function Test
- HBsAg
- PT INR (Prothrombin Time)

About This Test

Liver Function Tests (LFTs) and Hepatitis B Surface Antigen (HBsAg) are diagnostic tools to assess liver health and detect infections. - **LFTs** measure enzymes, proteins, and substances produced by the liver to evaluate its function. Key components include: - **SGOT (AST)** and **SGPT (ALT)**: Indicate liver cell injury. - **Alkaline Phosphatase (ALP)**: Assesses bile duct health. - **Bilirubin**: Measures waste product breakdown, revealing liver's ability to process and excrete it. - **Albumin**: Evaluates the liver's protein synthesis capability. - **Prothrombin Time (PT)**: Reflects clotting function, which depends on liver-produced proteins. - **HBsAg** detects the presence of the Hepatitis B virus. A positive result indicates an active Hepatitis B infection, which can be acute or chronic. Persistent HBsAg for over six months suggests chronic infection, requiring further evaluation to determine liver damage or infection severity. Together, these tests identify liver dysfunction, screen for viral hepatitis, and guide management for liver-related conditions.
