Profile Details | 1 Parameters

Fasting: Overnight fasting for 9-12 hours | Report Time: Next Day

Specimen Required: Stool

Price- ₹2500 **₹1999** 

## **Parameters Included**

## **About This Test**

The Helicobacter pylori (H. pylori) antigen stool test detects the presence of H. pylori antigens in a stool sample. H. pylori is a type of bacteria that can infect the stomach lining and is a common cause of peptic ulcers, chronic gastritis, and can contribute to the development of stomach cancer. \*\*Test Purpose:\*\* - \*\*Detection of Infection:\*\* Identifies current H. pylori infection by detecting bacterial antigens in the stool. - \*\*Monitoring Treatment:\*\* Evaluates the effectiveness of treatment for H. pylori infection as the absence of antigens post-treatment indicates successful eradication of the bacteria. \*\*Test Interpretation:\*\* - \*\*Positive Result:\*\* Indicates an active H. pylori infection. - \*\*Negative Result:\*\* Suggests the absence of an active infection, although it does not rule out a past infection that has been cleared. This non-invasive test is commonly used due to its simplicity and accuracy, helping in diagnosing H. pylori-related gastrointestinal conditions and monitoring treatment outcomes.
