About This Test

The Hepatitis C virus (HCV) total antibodies test measures the presence of antibodies against the hepatitis C virus in the blood. These antibodies are produced by the immune system in response to an HCV infection, indicating that a person has been exposed to the virus at some point. This test does not distinguish between a current active infection and a past resolved infection. A positive result usually requires further testing, such as an HCV RNA test, to determine if the virus is still present and if the infection is active.
