About This Test

The Herpes Simplex Virus 1 & 2 (HSV-1 & HSV-2) DNA PCR test measures the presence of herpes simplex virus DNA in a sample, typically from blood, tissue, or a swab of an active lesion. This test detects and differentiates between HSV-1 and HSV-2, the two types of herpes simplex viruses. PCR (Polymerase Chain Reaction) amplifies viral DNA, making it highly sensitive and specific for identifying active infections, even when viral loads are low. It is used to diagnose herpes infections, confirm suspected cases, and guide treatment decisions.
