## **HOMA-IR-INSULIN RESISTANCE INDEX**

Profile Details | 1 Parameters

Fasting: Overnight fasting for 9-12 hours | Report Time: Same Day

Specimen Required: Blood

Price- ₹1700 **₹895** 

## **Parameters Included**

## **About This Test**

\*\*HOMA-IR (Homeostasis Model Assessment of Insulin Resistance)\*\* is a method used to estimate insulin resistance, which is a condition where the body's cells do not respond effectively to insulin, leading to elevated blood glucose levels. \*\*Key Points:\*\* - \*\*Calculation:\*\* HOMA-IR is calculated using fasting plasma glucose and fasting insulin levels. The formula is: \[ \text{HOMA-IR} = \frac{(\text{Fasting Insulin} \, (\mu U/mL) \times \text{Fasting Glucose} \, (mg/dL))}{405} \] - \*\*Function:\*\* It provides an estimate of how well the body is managing glucose metabolism and insulin sensitivity. Higher values indicate increased insulin resistance. - \*\*Clinical Relevance:\*\* HOMA-IR is used to assess metabolic conditions such as type 2 diabetes, metabolic syndrome, and prediabetes. It helps in evaluating the effectiveness of interventions aimed at improving insulin sensitivity. - \*\*Interpretation:\*\* Normal values vary, but elevated HOMA-IR suggests significant insulin resistance, requiring further investigation and management strategies to improve metabolic health. The HOMA-IR index is a valuable tool for assessing and managing insulin resistance and related metabolic disorders.
