About This Test

The Leishmania IgG antibodies test measures the concentration of IgG antibodies against the *Leishmania* parasite in the blood. These antibodies are produced by the immune system in response to infection with *Leishmania*, which causes leishmaniasis. Elevated levels of IgG antibodies indicate exposure to or an active infection with *Leishmania*. This test is used to diagnose leishmaniasis, differentiate it from other diseases, and monitor treatment response. It is particularly useful in regions where leishmaniasis is endemic.
