About This Test

Procalcitonin is a blood biomarker that measures the levels of procalcitonin, a precursor of the hormone calcitonin. Elevated levels indicate a bacterial infection or sepsis, as procalcitonin levels rise in response to bacterial toxins and systemic inflammation. This test helps differentiate between bacterial and viral infections, guiding appropriate antibiotic treatment. It is particularly useful in managing patients with suspected sepsis, lower respiratory tract infections, and other serious bacterial infections, aiding in early diagnosis and monitoring treatment effectiveness.
