About This Test

A serum amoebic IgG test measures the concentration of Immunoglobulin G (IgG) antibodies specific to *Entamoeba histolytica*, the parasite responsible for amoebiasis. Elevated levels of serum amoebic IgG indicate exposure to or infection with *Entamoeba histolytica*. This test is used to diagnose amoebic infections, especially in cases where clinical symptoms suggest an infection but stool tests might be inconclusive. It helps confirm a diagnosis and determine whether an infection is recent or has been present for a longer period.
