About This Test

A Toxoplasma gondii IgG antibodies test measures the presence of IgG antibodies against Toxoplasma gondii in the blood. These antibodies indicate past exposure or infection with the parasite, which causes toxoplasmosis. A positive result suggests that the individual has been infected at some point and has developed immunity. This test helps in diagnosing toxoplasmosis, especially in pregnant women, immunocompromised patients, and individuals with unexplained symptoms, to determine the risk of reactivation or potential complications.
