About This Test

A **Typhi Dot IgM** test measures the presence of IgM antibodies against **Salmonella typhi** in the blood. **Salmonella typhi** is the bacterium responsible for typhoid fever. Here's what this test assesses: 1. **Detection of Recent Infection**: IgM antibodies are typically produced early in response to a new infection. The presence of IgM against **Salmonella typhi** suggests a recent or acute typhoid fever infection. 2. **Diagnosis of Typhoid Fever**: Helps confirm a diagnosis of typhoid fever, which is characterized by symptoms like prolonged fever, abdominal pain, and gastrointestinal issues. 3. **Differentiation from Other Conditions**: Assists in distinguishing typhoid fever from other febrile illnesses that may have similar symptoms. In summary, the Typhi Dot IgM test detects recent infections with **Salmonella typhi** by measuring specific IgM antibodies, aiding in the diagnosis of typhoid fever.
