About This Test

The 1,25-dihydroxy vitamin D3 test measures the active form of vitamin D in the blood. This form, also known as calcitriol, is crucial for calcium absorption, bone health, and regulating parathyroid hormone levels. It is often used to assess conditions related to kidney function, calcium metabolism, and parathyroid disorders. Abnormal levels can indicate issues such as vitamin D deficiency, kidney disease, or parathyroid gland dysfunction, aiding in the diagnosis and management of these conditions.
