About This Test

17-OH progesterone (17-hydroxyprogesterone) is a hormone measured to assess adrenal gland function and diagnose congenital adrenal hyperplasia (CAH). This test evaluates levels of 17-OH progesterone, which is a precursor in cortisol production. High levels may indicate CAH, a condition where the adrenal glands produce inadequate cortisol and aldosterone. It's also used to investigate hormonal imbalances in conditions like polycystic ovary syndrome (PCOS) and to monitor treatment in CAH.
