About This Test

A 24-hour urine test for metanephrines measures the levels of metanephrines, which are byproducts of the hormones epinephrine and norepinephrine. These hormones are produced by the adrenal glands. Elevated levels of metanephrines in the urine can indicate the presence of pheochromocytomas or paragangliomas, rare tumors of the adrenal gland. This test helps diagnose these tumors, which can cause high blood pressure, headaches, sweating, and rapid heart rate. Collecting urine over 24 hours ensures an accurate measurement of metanephrine levels, aiding in the timely and accurate diagnosis and management of these conditions.
