About This Test

A 24-hour urine test for microalbumin measures the amount of albumin, a type of protein, in the urine over a 24-hour period. Elevated levels of microalbumin in the urine can indicate early kidney damage, especially in individuals with diabetes or hypertension. Detecting microalbuminuria (small amounts of albumin in urine) helps in early intervention to prevent further kidney damage and manage underlying conditions. This test is crucial for monitoring kidney health and guiding treatment to protect renal function.
