About This Test

ABO and Rh typing are essential blood tests for determining blood group compatibility. - **ABO Typing** identifies one of four blood types—A, B, AB, or O—based on the presence or absence of A and B antigens on red blood cells. Blood type A has A antigens, type B has B antigens, type AB has both, and type O has neither. - **Rh Typing** determines the presence or absence of the Rh factor, a specific antigen on the surface of red blood cells. If the Rh factor is present, the blood type is Rh-positive (+); if absent, it is Rh-negative (–). Together, ABO and Rh typing ensure compatibility for blood transfusions, organ transplants, and help manage pregnancy-related conditions to prevent immune reactions and complications.
