About This Test

The Acetylcholine Receptor Antibody (AChR-Ab) test is a blood test used to detect antibodies against acetylcholine receptors. These antibodies are associated with myasthenia gravis, an autoimmune disorder characterized by muscle weakness and fatigue. In myasthenia gravis, the immune system mistakenly attacks acetylcholine receptors at the neuromuscular junction, impairing muscle contraction. A positive AChR-Ab test indicates the presence of these antibodies, confirming the diagnosis. This test is crucial for diagnosing myasthenia gravis and guiding appropriate treatment to manage symptoms and improve the patient's quality of life.
