About This Test

The ANA ELISA (Antinuclear Antibody Enzyme-Linked Immunosorbent Assay) test measures the level of antinuclear antibodies (ANAs) in the blood. ANAs are antibodies that target the body's own nuclear components. The test uses an enzyme-linked reaction to detect and quantify these antibodies. Elevated ANA levels can suggest autoimmune disorders such as systemic lupus erythematosus (SLE) or rheumatoid arthritis. The ANA ELISA test provides a quantitative measure of these antibodies, helping to assess the presence and extent of autoimmune activity.
