

ANCA - ANTI NEUTROPHIL CYTOPLASMIC ANTIBODIES BY IFA MEATHOD

Profile Details | 1 Parameters

Fasting: Overnight fasting for 9-12 hours | Report Time: Within 4 Days

Specimen Required: Blood

Price- ₹2980 **₹1690**

Parameters Included

About This Test

ANCA (Anti-Neutrophil Cytoplasmic Antibodies) is a test that measures the presence of specific antibodies in the blood that target proteins in neutrophils, a type of white blood cell. The ANCA test is primarily used to help diagnose and manage autoimmune diseases, particularly those that involve systemic vasculitis, which is inflammation of blood vessels. Key points about the ANCA test: - **Types:** There are two main types of ANCA, based on the staining pattern observed in the test: c-ANCA (cytoplasmic ANCA) and p-ANCA (perinuclear ANCA). These types correspond to different autoimmune conditions. - **Conditions:** Elevated levels of ANCA are associated with various autoimmune diseases, including Wegener's granulomatosis (now called granulomatosis with polyangiitis), microscopic polyangiitis, and Churg-Strauss syndrome. - **Diagnostic Use:** The test helps in diagnosing these conditions, assessing disease activity, and monitoring response to treatment. Overall, the ANCA test is a valuable tool in the evaluation of autoimmune disorders and related inflammatory conditions.
