About This Test

An **Anti-DNase B antibody** test measures the level of antibodies against the enzyme DNase B in the blood. DNase B is produced by certain strains of *Streptococcus* bacteria, particularly *Streptococcus pyogenes*, which is known to cause infections such as strep throat and skin infections. Here's what this test assesses: 1. **Recent Streptococcal Infection**: Elevated levels of anti-DNase B antibodies indicate a recent or past infection with *Streptococcus pyogenes*. This test helps confirm that an infection has occurred, particularly when other clinical signs are present. 2. **Rheumatic Fever and Glomerulonephritis**: The test is useful in diagnosing complications of streptococcal infections, such as rheumatic fever and post-streptococcal glomerulonephritis, which are inflammatory conditions that can occur after an untreated strep infection. 3. **Monitoring Infection**: Helps in tracking the immune response to a streptococcal infection and assessing recovery. In summary, an Anti-DNase B antibody test measures the level of antibodies against DNase B to help diagnose recent streptococcal infections and related complications.
