About This Test

Anti-HBc total refers to total antibodies produced by the immune system in response to the Hepatitis B core antigen (HBcAg). This test detects both IgM and IgG antibodie against HBcAg, indicating previous or ongoing infection with Hepatitis B virus (HBV). Anti-HBc total antibodies are typically detectable during the acute phase of HBV infection and persist for life in individuals who have recovered from HBV infection or are chronically infected. Testing for Anti-HBc total antibodies is crucial for diagnosing past exposure to HBV, confirming immunity status in vaccinated individuals, and differentiating between acute and chronic HBV infection. It is an essential component of hepatitis serology panels and aids in clinical management and public health surveillance of hepatitis B.
