About This Test

Anti-HEV IgM refers to Immunoglobulin M antibodies produced by the immune system in response to the Hepatitis E virus (HEV). This specific antibody test is used to dete recent or acute Hepatitis E virus infection. IgM antibodies against HEV typically appear early in the course of infection, within 1-4 weeks after exposure, and can persist fo several months. Testing for Anti-HEV IgM is crucial for diagnosing acute hepatitis E, distinguishing it from other types of viral hepatitis, and assessing the stage of the disease. It aids in early detection, timely medical intervention, and public health measures to prevent further transmission of Hepatitis E virus.
