About This Test

The anti-soluble liver antigen (anti-SLA) test measures antibodies against soluble liver antigens in the blood. These antigens are proteins found in the liver, and the presence of anti-SLA antibodies is often associated with autoimmune liver diseases, particularly autoimmune hepatitis. The test is useful for diagnosing and differentiating autoimmune hepatitis from other types of liver disease. Elevated levels of anti-SLA antibodies indicate an immune response targeting liver cells, which can aid in confirming the diagnosis of autoimmune hepatitis and guiding treatment strategies. Accurate detection of anti-SLA antibodies helps in the management of autoimmune liver conditions and monitoring disease progression.
