About This Test

An Aspergillus IgE test measures the levels of Immunoglobulin E (IgE) antibodies in the blood that are specific to Aspergillus, a common type of fungus. This test is used to identify allergic reactions to Aspergillus, which can lead to conditions such as allergic bronchopulmonary aspergillosis (ABPA) and other Aspergillus-related respiratory issues. Elevated Aspergillus IgE levels indicate that the immune system has been sensitized to the fungus and is producing IgE antibodies in response. This sensitization can result in symptoms like coughing, wheezing, shortness of breath, and exacerbated asthma. The test helps in diagnosing and monitoring these allergic responses, guiding appropriate treatment plans for affected individuals.
