About This Test

C-peptide fasting is a blood test that measures the level of C-peptide in the bloodstream after an overnight fast. C-peptide is a protein produced in equal amounts with insulin during the cleavage of proinsulin into insulin. This test helps assess the body's ability to produce insulin naturally. It is used to distinguish between type 1 and type 2 diabetes, as C-peptide levels are typically low in type 1 diabetes (indicating little to no insulin production) and may be normal or elevated in type 2 diabetes (indicating insulin resistance or preserved insulin production).
