About This Test

A C-peptide postprandial test measures the level of C-peptide in the blood after eating. C-peptide is a byproduct of insulin production, released from the pancreas alongside insulin. This test helps assess the pancreas's ability to produce insulin in response to food intake. Elevated C-peptide levels can indicate insulin resistance or excess insulin production, while low levels may suggest insufficient insulin production, such as in type 1 diabetes. It aids in evaluating and managing diabetes and related conditions.
