About This Test

CA 125 is a protein antigen that is often measured through a blood test. It is primarily used as a tumor marker to detect the presence and monitor the progression of ovarian cancer. Elevated levels of CA 125 may also indicate other types of cancers, such as endometrial, fallopian tube, or peritoneal cancers, though it is most commonly associated with ovarian cancer. CA 125 is not specific to cancer and can be elevated in non-cancerous conditions, including pelvic inflammatory disease, endometriosis, menstruation, and liver cirrhosis. Despite its limitations, CA 125 remains a valuable tool in combination with other diagnostic tests and imaging to aid in the early detectio of ovarian cancer, monitor treatment response, and detect cancer recurrence.
