

CA 15.3- BREAST CANCER MARKER

Profile Details | 1 Parameters

Fasting: Fasting not mandatory | Report Time: Next day

Specimen Required: Blood

Price- ₹1499 **₹699**

Parameters Included

About This Test

CA 15-3 is a protein antigen found on the surface of certain cancer cells, particularly breast cancer cells. It is primarily used as a tumor marker to monitor disease progression, assess treatment response, and detect recurrence in patients diagnosed with breast cancer. CA 15-3 levels are measured through a blood test, which helps healthcare providers monitor the course of the disease over time. Elevated levels of CA 15-3 can indicate active breast cancer cells, but it is not specific to breast cancer and can be elevated in other types of cancers and non-cancerous conditions. Therefore, CA 15-3 testing is typically used in combination with other diagnostic tools, such as imaging studies and clinical evaluations, to provide a comprehensive assessment of breast cancer status and guide treatment decisions. Regular monitoring of CA 15-3 levels is particularly useful for patients undergoing treatment and follow-up care, helping to tailor therapeutic approaches and improve outcomes.
