About This Test

A cardiolipin antibody IgA test measures the level of IgA antibodies against cardiolipin, a type of lipid found in cell membranes. Elevated levels of these antibodies can indicate an increased risk of autoimmune conditions, particularly antiphospholipid syndrome (APS), which can lead to blood clotting disorders and complications during pregnancy. The test is often used to assess the presence of APS, especially when combined with other antiphospholipid antibodies tests, to evaluate thrombotic risk and guide treatment.
